Rule-based machine learning

Apriori

Market Basket Analysis

- ❖ Transaction Data
 - Forget the sample, it's the feature
 - Binary

Association Rules

❖ Causality (direct dependency) $A \rightarrow B$

❖ Correlation (strength & direction of linear relation)

Association Rules

- ❖ Causality (direct dependency) $A \rightarrow B$
- ❖ Correlation (strength & direction of linear relation)
- ❖ Association (gives info about, any relation)
 - May have a common cause
 - Coffee prevents skin cancer?
 - Behavior modeling
 - Frequency and co-occurrence

Finding association rules

- ❖ An itemset
- ❖ A frequent itemset
- ❖ An association rule
 - body (antecedent) AND head (consequent)
 - {Bread, Butter} => {Milk}
- ❖ Many potential rules within one frequent itemset
 - Rule: split and imply

Frequent itemsets are expensive

- ❖ Based on num. unique features
 - Exponential growth of possible itemsets
 - Hyperparams to control

Apriori

- ❖ Freq. itemsets are anti-monotonic in set theory

All non-empty subsets of a frequent itemset must be frequent.

=

If an itemset is infrequent, all its supersets will be infrequent.

- ❖ Reduce search space in candidate generation

Terminology

- ❖ *Transaction*: sample
- ❖ *Item/Itemset/k_itemset*: feature/set of features/ set of k features
- ❖ Evaluation & Thresholding
 - **Itemset Support**(*itemset*): How often does
itemset happen?
$$\text{trans. itemset} / \text{total trans.}$$
 - **Rule Confidence**(*body*→*head*): When *head*, how often *body*?
$$\text{trans. } \textit{body} \text{ AND } \textit{head} / \text{trans. body}$$

Terminology II

- ❖ **Rule Lift**($body \rightarrow head$): dependence between prob. of body and head

$$\frac{\text{support}(body \rightarrow head)}{\text{support}(body) * \text{support}(head)} = \frac{\text{confidence}(body \rightarrow head)}{\text{support}(head)}$$

- ❖ Lift = 1 : Independence between *body* and *head*.
- ❖ Lift < 1 : *body* has inhibition effect on *head*
- ❖ Lift > 1 : *body* has presence effect on *head*

Pruning

- ❖ *Support* to reduce search space of itemsets
- ❖ Confidence to discard irrelevant rules
- ❖ *Of special interest:*
 - *Maximal itemset*: No superset is freq. itemset
 - *Closed itemset*: All supersets have lower support

Apriori in action

```
itemsets = all_features
```

```
For K=1...N
```

```
    freq_itemsets += [i in itemsets of size k & above support]
```

```
    itemsets= pair_wise_union(freq_itemsets)
```

Limitations

- ❖ Transaction data
 - Binary only!
 - Samples are clones
 - Pre-clustering & merging to mitigate

Limitations

- ❖ Num. candidates to check explodes with
 - Many itemsets
 - Large itemsets
 - Low support
- ❖ FP-Growth
 - One order of magnitude faster. Still limited.

By hand

- ❖ `freq_itemsets` = all itemsets
- ❖ filter `freq_itemsets` by support
- ❖ $k = 2$
 - Combine `freq_itemsets` to make larger itemsets ($k+1$)
 - pairs sharing $k-1$ elements
 - filter `freq_itemsets` by support
 - if empty, break
 - produce association rules
